

In-Place Masking Requirement for Tables Without a Primary Key

In K2View, in-place masking requires every table involved in the masking process to have a primary key.

If a table does not have a primary key, the masking operation will fail.

To resolve this, one column must be designated as the primary key.

Methods to Set a Primary Key

1. Update Primary Key Using catalog_field_info.csv

Steps:

- Open catalog_field_info.csv.
- Identify the table and the column to be designated as primary key.
- Set pk = true.

Limitation:

- When BuildArtifact from Catalog is executed, catalog files are regenerated.
- Manual edits in catalog_field_info.csv will be lost.

2. Update Primary Key in the Fabric Model (Recommended)

Steps:

- In the Fabric model, open the table and select the appropriate column.
- Add property: pk = true.
- Rebuild artifacts.

Limitation:

- Once a column is set as a primary key and artifacts are built, it cannot be reverted through normal configuration.

Summary

Method 1: Modify catalog_field_info.csv

Pros: Quick

Cons: Not persistent after BuildArtifact

Method 2: Define PK in Fabric Model

Pros: Permanent and reliable

Cons: Cannot revert the PK later
